

The HFEA — who we are and what we do

The Human Fertilisation and Embryology Authority (HFEA) was set up in 1991 to licence and regulate clinics which provide:

- *in vitro* fertilisation (IVF) treatment
- donor insemination (DI) treatment
- gamete intra fallopian transfer (GIFT) where donated sperm or eggs are used in treatment
- storage of gametes or embryos.

The HFEA also licenses clinics that carry out research involving human embryos. These activities can only be carried out if the clinic obtains a licence from the HFEA. As well as licensing research and treatment clinics, the HFEA also:

- publishes a Code of Practice giving guidance to clinics on how they should carry out licensed activities;
- keeps a confidential register of information about donors, patients and treatments;
- gives advice and information to licensed clinics;
- gives information and advice to people seeking fertility treatment, to donors and the general public.

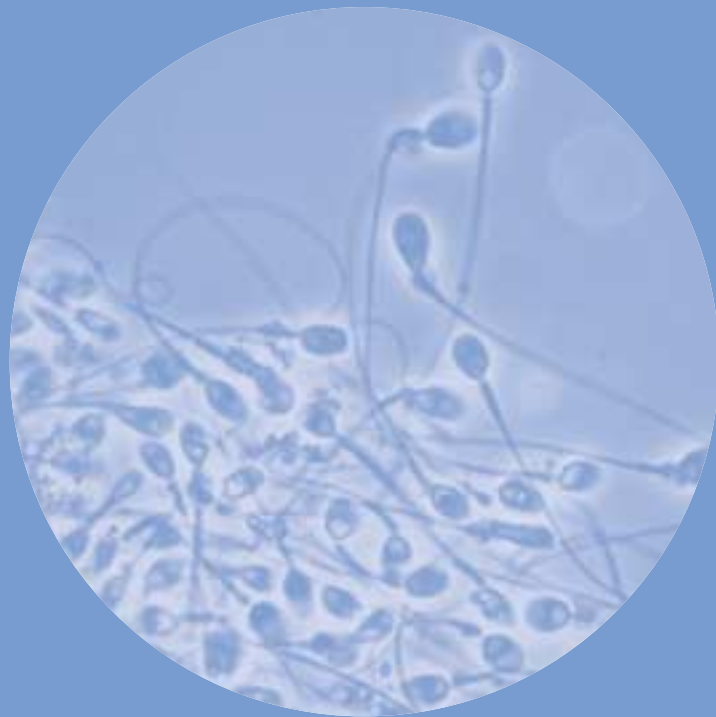

The HFEA exists to safeguard, protect and reassure patients, professionals and the public about licensed infertility treatments and human embryo research.

The HFEA inspects all licensed treatment centres annually, requiring and helping all centres to achieve, and adhere to, the high standards in our Code of Practice. The HFEA remains one of the few national statutory bodies of its kind in the world.

'The Patients' Guide to IVF Clinics' and 'The Patients' Guide to Infertility and IVF'

Introduction

If you are unsure whether you need treatment for infertility, or what treatment you might need, you should first read the HFEA's booklet, 'The Patients' Guide to Infertility and IVF'.

The purpose of this booklet is to give advice and information to people considering treatment with sperm from a donor. It may also be of interest to men who may wish to consider becoming donors.

Donor insemination treatment (DI) involves the use of sperm from an anonymous donor. It can be used if the male partner has no sperm or very poor sperm or risks passing on an inherited disease. DI may also be used to treat single women or lesbian couples.

The law requires that everyone has to undergo an assessment at the clinic before treatment is offered (see 'welfare of the child', page 3).

PLEASE NOTE

We are writing this booklet as if for a couple. We appreciate that not all patients are in a relationship. The information contained in this booklet is relevant to all those seeking treatment.

What is involved?

Donor insemination involves the use of sperm from a donor. It is straightforward and usually painless. Using a fine tube, the doctor or nurse places the semen into the neck of the womb or the uterus. The patient will be asked to rest for a short time after this treatment. Sexual intercourse can usually continue as normal during a treatment cycle.

Donor insemination is performed during the fertile period each month. This is likely to be about the middle of the woman's menstrual cycle. Whilst the woman may observe a change in vaginal mucus during this fertile period, blood or urine hormone tests or ultrasound scans are usually used to establish accurately the most suitable time for insemination. Sometimes hormone drugs are used to stimulate the ovaries.

All pregnancies carry some risks, and donor insemination does not protect patients from these.

About the donors

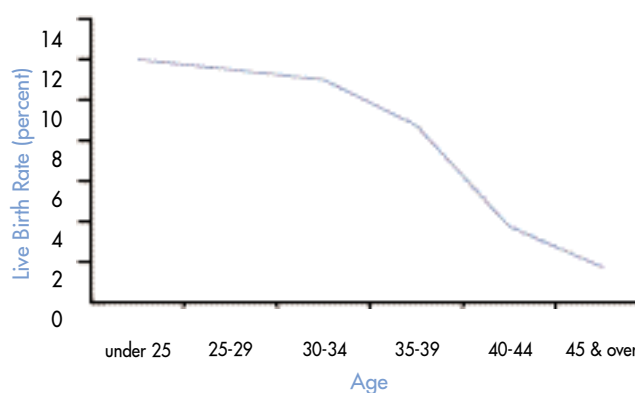

Sperm donors are men aged between 18 and 55 with a relatively high sperm count who have undergone health screening, such as for hepatitis and sexually transmitted diseases including HIV. Screening for HIV involves sperm being frozen and quarantined for at least six months. Donors can be paid up to £15 plus expenses per donation. The law states that their donations will remain anonymous. (Occasionally a clinic will treat a patient with sperm from a donor who is already known to them. See 'welfare of the child', page 3).

Clinics do their best to use sperm from a donor who has similar physical characteristics as the male partner, e.g. skin colour, eye colour, blood group, hair colour and body build. However, this requires a large and constant source of donors and it may be difficult to provide a match. The result of any attempt at matching physical characteristics cannot be guaranteed. Clinics should discuss any deviations from a 'good' match with their patients.

Chances of success

Your chances of success decrease with age. At present women under 30 achieve a live birth rate of 10-12% per treatment cycle, but this begins to decrease after that age. Women aged 35-39 have a 9% chance of a live birth, and women over 40 have only a 3-4% chance of successful pregnancy for each DI cycle. However, these are only averages. Your individual circumstances will influence the likelihood of success in your own particular case.

FIG.1 DI live birth rate by age of woman

'Welfare of the child'

The Human Fertilisation and Embryology Act 1990 states that, before offering anyone treatment a clinic must: *'take account of the welfare of any child who may be born as a result of the treatment (including the need of that child for a father), and of any other child who may be affected by the birth'.*

This means that the clinic will ask you a number of personal questions. Your ages and the medical histories of you and your families will be considered. So too will the needs of any child or children who may be born, and your ability to meet those needs.

Clinics should also consider any risk of harm from neglect or abuse to any child who may be born. They will also take account the effect of a new baby upon any existing child of the family. Clinics must seek to satisfy themselves that the GP of each prospective parent knows of no reason why either of them should not be offered treatment. Before seeking such reassurance from your GP the clinic must obtain your consent. Failure to give consent will be taken into account by the clinic in considering whether or not to offer treatment.

Some clinics, as a matter of policy, do not offer treatment to single women or to unmarried couples. Most clinics have upper age limits for women they are prepared to treat, although the HFEA has not itself set a national age limit.

In considering you for treatment, clinics will take all these factors into account as well as the possible effects of the treatment on your own welfare.

Counselling

Before starting treatment clinics must offer you the opportunity to receive counselling. Counselling provides an opportunity to discuss with an impartial person any concerns you may have about your treatment, its implications for you or infertility generally. However, you do not have to accept offers of counselling if you do not feel it would be helpful.

The HFEA Code of Practice sets out the types of counselling that should be available through all licensed clinics.

These include:

- *implications counselling*: to enable the people concerned to understand the implications of the proposed course of action for themselves, for their family and for any children born as a result. This may be particularly relevant for people considering treatment with donated sperm, eggs or embryos. This may also include genetic counselling;
- *support counselling*: to give emotional support at times of particular stress, e.g. when there is a failure to achieve a pregnancy;
- *therapeutic counselling*: which aims to help people to cope with the consequences of infertility and treatment and resolve the problems these may cause. It includes helping people to adjust their expectations and to come to terms with their situation.

While all licensed clinics must offer counselling, the emphasis placed on it can vary. Some clinics insist on counselling before offering certain treatments. It may also be useful for you to contact one of the national support groups who may be able to put you in touch with others who have had DI treatment (see pages 9-10).

Confidentiality

Donor insemination notes are kept securely and separately from general hospital records in such a way that confidentiality is preserved. The identity of the donor is strictly confidential, but you may obtain some non-identifying information about him. Similarly, your name will not be known to the donor.

Clinics are required to collect and pass on information about donors, recipients and treatment cycles to the HFEA for its confidential Register. The purpose of the Register is to enable people over the age of 18 (or 16 if contemplating marriage) to find out whether they were born as a result of licensed fertility treatment (i.e. donor insemination, *in vitro* fertilisation) and, if so, whether they are related to someone they intend to marry.

a) Legal aspects

Any child born to a married woman following donor insemination is legally the child of her husband, unless he did not consent to his wife's treatment. For unmarried couples, any child born to a woman following donor insemination is legally the child of her male partner treated together with her. Clinics should also explain that, when a child is born to an unmarried couple, the male partner may not have parental responsibility for that child under the Children Act 1989.

Unmarried couples are recommended to seek their own legal advice about the male partner's rights and responsibilities towards any child who may be born as a result of treatment. The donor is not the child's legal father and has no legal responsibilities for the child.

b) Looking towards the future

Before undergoing donor insemination treatment you may wish to think carefully about the various aspects of having a child through this treatment. You might consider such matters as whether, and how, you will wish to tell your potential child about his or her origin by donor insemination. He or she will have the legal right at the age of 18, upon application to the HFEA and after the opportunity for appropriate counselling, to find out about his or her origin by donor insemination. Non-identifying information about the donor may be made available to the child. There may

be provision in the future for children born of such treatments to obtain further information about donors.

From 2008 onwards, anyone over the age of 16 who believes they have been conceived with donor sperm on or after 1 August 1991 and is thinking of getting married will be able to obtain information if they wish to check whether they might be related to their intended partner.

You may wish to speak to a counsellor about the implications of having a child through donor insemination (see 'Counselling' on page 3), and you also may wish to contact a patient support group (see pages 9-10).

Multiple births

There is a greater risk of multiple pregnancy and births (usually twins or triplets) if drugs are used to stimulate ovulation before insemination. The risk of multiple birth is not as great with DI as with other treatments such as IVF, although about one in 15 DI births will be either twins or triplets.

While the prospect of twins or triplets may seem attractive, there are many serious risks associated with multiple births. Research has shown that multiple births can lead to a much higher risk of:

- complications during pregnancy;
- premature birth and low weight birth;
- disability;
- death of infants at, or within, 28 days of birth (known as neonatal death).

In addition to the serious risks to the babies' health, a multiple birth can create enormous strains for the parents, including financial difficulties and emotional and physical exhaustion. In some cases the joys of parenthood are greatly reduced by these problems.

Risks of DI

When hormone drugs are used to stimulate the ovaries some women experience mild unpleasant symptoms as a reaction to the drugs, but these are normally short-lived and are no cause for concern. They may include hot flushes, feelings of depression and irritability, headaches and restlessness at night.

Despite careful monitoring, a small number of women may develop ovarian hyperstimulation syndrome (OHSS). The majority of these women have a mild or moderate form of over-response to the drugs, and complain of pain and mild abdominal swelling. In some cases cysts may appear on the ovaries and fluid may collect in the abdominal cavity causing discomfort. The condition should be monitored by a fertility specialist, and in some cases the cycle may have to be abandoned.

In about 1% of cases severe ovarian hyperstimulation causes a very large number of eggs to develop and the ovaries to swell. Symptoms such as nausea and vomiting, abdominal pain and swelling and shortness of breath may occur. A woman may also feel weak and faint and notice a reduction in urine output. These complications require urgent hospital admission to restore the fluid balance and monitor progress.

Patients should:

- ask for information about how the clinic tries to avoid OHSS;
- be made aware of the symptoms to look out for.

If you are at all worried during your treatment, you should always contact the clinic. Their phone numbers (including an emergency phone number) should be easily found in their information leaflets.

The following list summarises certain questions you may wish to ask clinics before deciding which to attend.

- What tests will be carried out by the clinic?
- Does the clinic recommend the use of drugs with DI? If so, why?
- Are there any restrictions to treatment at the clinic?
- Is there a waiting list for treatment?
- How many visits to the clinic will be needed?
- Is the treatment available on the NHS?
- If not, what is the cost of treatment? What does this cover?
- What kind of monitoring is carried out? Why is this the preferred method?
- How many inseminations are done in each cycle?
- Does the clinic use vaginal, cervical or uterine insemination? Why is this the preferred method?
- What is the clinic's policy on screening sperm donors? Does the clinic offer genetic screening for cystic fibrosis and other genetically transmitted diseases and conditions?
- Does the clinic have a wide selection of donor sperm to choose from?
- How are sperm donors recruited?
- How many cycles does the clinic recommend before considering other treatment options?
- What information does the clinic provide?
- What counselling is available?
- What are the chances of multiple birth?
- What will happen if the treatment is successful?
- What will happen if the treatment is not successful?
- Does the clinic have a patient support group?
- How might I tell my child about their origins?
- Is it possible to see a female (or male) doctor?
- Will we be seen by the same doctor throughout?
- Are any of the clinic's facilities shared with other units, such as the maternity unit?
- How long has the clinic been established?
- How does the clinic involve the male partner in the treatment?
- What other treatments do you offer?

1. Should I treat the list of clinics as a league table and go to the one with the highest live birth rate?

No. Many other factors can be equally as important. These can include the location of the clinic, costs, waiting times, experience of special techniques and its policy on multiple births. Patients must feel comfortable and confident with their choice, and they should use our Guide as a starting point rather than as a source of comprehensive information.

2. What information is the clinic obliged to provide for its patients?

All UK licensed clinics must supply written information to prospective patients before offering treatment. This information should give details about the services offered, any risks involved, costs, previous live birth rates and complaints procedure. This literature should be comprehensive and easy to understand, although staff at the clinic will explain any points which are unclear. The HFEA Code of Practice gives details.

3. What 'consents' will I be asked to give?

Before beginning treatment the clinic must obtain your written 'informed' consent. This means that you have been given information about the procedures, had the opportunity to discuss the treatment with the clinic's staff, had the opportunity to receive counselling and had time to think about your decision. You may choose to change or withdraw your consent at any time before your sperm, eggs or embryos are used in treatment.

You will be offered counselling before proceeding with the treatment. This provides an opportunity to discuss with an impartial person any concerns you may have about your treatment, its implications for you or infertility generally. Some people find counselling particularly helpful when they are considering whether to receive treatment with donated sperm or eggs. However, you do not have to accept offers of counselling if you do not feel that it would be helpful for you.

4. Will my treatment remain confidential?

Yes. In addition to a doctor's responsibility to keep your medical records confidential, the Human Fertilisation and Embryology Act 1990 imposes particular duties in respect of IVF and DI patients and donors. The clinic may not disclose information about your treatment to anybody (apart from clinic staff), even your GP, without first obtaining your written consent. To do so, other than in very exceptional circumstances, is a criminal offence.

Where donated sperm has been used, the identity of the donor is kept strictly confidential, so you cannot learn his identity, but you may obtain some non-identifying information about him. Similarly, your name will not be known to the donor. However, clinics are required to collect and pass on information about the donors, recipients and treatment cycles to the HFEA for its confidential Register. The purpose of the Register is to enable people over the age of 18 (or 16 if contemplating marriage) to find out whether they were born as a result of licensed fertility treatment, and, if so, whether they are related to someone they intend to marry. There may be provisions in the future for children born of such treatments to obtain further information about donors.

5. How can I complain?

The HFEA requires every licensed clinic to have its own complaints procedure, and the handling of these complaints is monitored as part of the HFEA's inspection procedure. If a patient, donor or anyone else feels that a clinic has not dealt with their complaint adequately, they should write to the HFEA.

6. What will happen if the treatment is successful?

The extent to which clinics remain involved after treatment varies. Some clinics may carry out a pregnancy test and some provide ante-natal care. Others discharge patients to the care of their own GP or consultant. These differences may be important to you. You should consider discussing them with the clinic.

The clinic needs to know the outcome of your treatment and will be able to offer advice and support.

7. What will happen if the treatment is not successful?

If the treatment does not lead to a pregnancy then there may be several options. In any event, the clinic should offer you advice and counselling. You may decide to try again, try a different type of treatment or withdraw from further treatment.

You might ask the clinic how many cycles of treatment are given before further investigations are undertaken or other forms of treatment considered.

The staff at the clinic, the independent counsellor and your GP or consultant, (if they have been informed of the treatment), should be able to offer advice and support.

Information and advice about fertility treatment is available from your GP or consultant and from the doctor, nurses and counsellor at the licensed clinic.

Each clinic produces its own patient information, describing the services available and explaining what is involved in treatment.

In addition, information is available from the following organisations.

Patient Organisations

CHILD

(The National Infertility Support Network)

Provides factsheets, a quarterly magazine, publications, medical advice and emotional support including helplines, local groups and local and national meetings. Membership is not a prerequisite for assistance. They can be contacted at:

Charter House, 43 St Leonards Road
Bexhill-on-Sea, East Sussex TN40 1JA

Tel: 01424 732361

Fax: 01424 731858

E-mail: office@email2.child.org.uk

<http://www.child.org.uk>

ISSUE (The National Fertility Association)

Members receive independent individual support and information. Members and non-members alike can telephone for help. Callers are answered personally 24 hours a day. Confidential telephone counselling by qualified counsellors is available to all every weekday evening. They can be contacted at:

114 Lichfield Street, Walsall WS1 1SZ

Tel: 01922 722888

Fax: 01922 640070

E-mail: webmaster@issue.co.uk

<http://www.issue.co.uk>

DONOR CONCEPTION NETWORK

Provides contact and support for those who have children, or plan family creation, conceived using donated gametes through donor insemination (DI) and IVF with donor sperm or donated eggs.

They can be contacted at:

P O Box 265, Sheffield S3 7YX

Tel/Fax: 020 8245 4369

<http://www.dcnetwork.org>

NATIONAL INFERTILITY AWARENESS CAMPAIGN (NIAC)

Provides advice and information to couples who are experiencing difficulties securing funding for infertility treatment. They can be contacted through the patient organisations CHILD and ISSUE.

NATIONAL CHILDBIRTH TRUST (NCT)

Offers information and support in pregnancy, childbirth and early parenthood. They aim to give every parent the chance to make informed choices.

They can be contacted at:

Alexandra House, Oldham Terrace, London W3 6NH

Tel: 020 8992 8637

9.30-4.30 Monday to Friday

Fax: 020 8992 5929

TWINS & MULTIPLE BIRTHS ASSOCIATION (TAMBA)

Provides support for families with twins, triplets or more, and for professionals involved with their care. Network of local Twins Clubs, specialist support groups, publications and an information pack.

They can be contacted at:

PO Box 30, Little Sutton, South Wirral L66 1TH

Confidential helpline: 01732 868000 open:

7pm-11pm weekdays, 10am-11pm weekends.

Other Organisations

BRITISH INFERTILITY COUNSELLING ASSOCIATION (BICA)

BICA aims to promote high quality, accessible counselling services for people with fertility problems. The Association offers information to patients who are seeking details of counsellors specialising in infertility.

They can be contacted at:

69 Division Street, Sheffield S1 4GE

Information line: 01342 843880

<http://www.bica.net>

MULTIPLE BIRTHS FOUNDATION

Provides professional support and information about all aspects of multiple births.

They can be contacted at:

4th Floor, Hamm House, Hammersmith Hospital

Du Cane Road, London W12 0HS

Tel: 020 8383 3519

Fax: 020 8383 3041

PROGRESS EDUCATIONAL TRUST

Provides information on fertility and genetics, and promotes discussion on their ethical and legal implications.

Publishes a news journal, 'Progress in Reproduction'.

They can be contacted at:

140 Grays Inn Road,

London WC1X 8AX

Tel: 020 7278 7870

Fax: 020 7278 7862

E-mail: admin@progress.org.uk

Please note this list is not exhaustive.

National data statistics are used below as an illustration. This data and individual clinic data covers the period 1 April 1998 - 31 March 1999.

Address and Contact
This is the address and telephone number you should use to contact the clinic.

Licensed for
This is a list of licensed treatment services provided by the clinic.

Patients treated
4,338 patients received DI treatment. (Some patients will have had more than one treatment cycle).

Non fee paying
This applies only to the actual treatment procedure, and is typically NHS funded treatment.

Results for DI treatments
1,023 single babies, 65 twins (130 babies) and 7 triplets (21 babies) were born from treatment. These figures include stillbirths and neonatal deaths.

		Triplet births 7
		Gamete Intra Fallopan Transfer (donor gametes only)
		Number of GIFT treatment cycles 18

Treatment cycles started (Includes stimulated and unstimulated cycles)
Of the 9,004 treatment cycles started by women below 38 years, 977 or 10.9% resulted in a live birth.

Of the 11,035 treatment cycles started by all women, 1,087 or 9.9% resulted in a live birth.

Number of GIFT treatment cycles
18 GIFT treatment cycles used donor eggs or sperm. (GIFT cycles using couples own eggs or sperm are not subject to HFEA licence and therefore no data is collected).

Stimulated treatment cycles
Of the total number of treatment cycles, 4713 used ovarian stimulatory drugs.

Patients treated	53
Stimulated treatment cycles	48
Singleton births	20
Twin births	1
Triplet births	0
Gamete Intra Fallopian Transfer (donor gametes only)	
Number of GIFT treatment cycles	0

Abandoned cycle

In IVF where a treatment cycle is cancelled after commencing administration of drugs, but at any stage before embryo transfer.

Assisted hatching

The mechanical, chemical or laser breaching of the gelatinous coating of the egg.

Cervical mucus

The secretions surrounding the cervical canal. The amount and texture changes during ovulation to allow sperm penetration.

Counselling

All licensed clinics are required to offer patients counselling. Such counselling aims to enable the patient to understand the implications of treatment, to give emotional support and to help the patient cope with the consequences of treatment.

Cryopreservation

The storage of gametes or embryos by freezing at low temperatures.

Donor Insemination (DI)

The insemination of donor sperm into the vagina, the cervix or the womb itself.

Egg collection

Procedure by which eggs are collected from the woman's ovaries by using an ultrasound guided needle or by using a laparoscope (an instrument for looking into the abdomen) and a needle. Also known as egg retrieval.

Embryo

A fertilised egg up to eight weeks of development.

Embryo freezing

Embryos not required for treatment in a cycle can be frozen and stored for future use. Freezing is also known as cryopreservation.

Embryo transfer

Transfer of one or more embryos to the uterus.

Embryo storage

The storage of one or more frozen embryos for future use.

Endometriosis

A female condition in which endometrial cells, which normally line the uterus, implant around the outside of the uterus

and/or ovaries, causing internal bleeding, pain and reduced fertility.

Epididymis

Coiled tubing outside the testicles which store sperm.

Fallopian tube(s)

The tubes between the ovaries and the uterus. After release of the egg from one of the ovaries, the tube transports the egg to the uterus.

Fetus

The term used for an embryo after the eighth week of development until birth.

Follicle(s)

A small sac in the ovary in which the egg develops.

Gamete

The male sperm or the female egg.

Gamete Intra Fallopian Transfer (GIFT)

A procedure in which eggs are retrieved from the woman, mixed with sperm and immediately replaced in one or other of the woman's fallopian tubes so that they fertilise inside the body.

Gonadotrophins

Drugs used to stimulate the ovaries similar in composition to natural follicle stimulating hormone (FSH) produced by the pituitary gland

Hamster test (HEPT)

A test of the fertilising ability of human sperm by observing their penetration into the hamster egg.

HFEA

Human Fertilisation and Embryology Authority.

Intra Cytoplasmic Sperm Injection (ICSI)

A variation of IVF treatment where a single sperm is injected into the inner cellular structure of the egg.

Intrauterine Insemination

Insemination of sperm into the uterus of a woman.

In Vitro Fertilisation (IVF)

Eggs and sperm are collected and put together to achieve fertilisation (IVF) outside the body.

Live birth

The delivery of one or more babies.

Live birth rate

The number of live births achieved from every 100 treatment cycles commenced.

Menstrual cycle

A cycle of approximately one month in the female during which the egg is released from an ovary, the uterus is prepared to receive the fertilised egg and blood and tissue are lost via the vagina if a pregnancy does not occur.

Microsurgical Epididymal Sperm Aspiration (MESA)

Retrieving sperm directly from the epididymis.

Multiple birth

Birth of more than one baby from a pregnancy.

Multiple birth rate

This is the percentage of all births in which more than one baby was born.

Multiple pregnancy

This is the percentage of all pregnancies in which two or more fetal hearts are present.

Natural/Unstimulated cycle

No drugs were given to stimulate egg production.

Neonatal death

The death of a baby within 28 complete days of delivery.

Ovarian Hyperstimulation Syndrome (OHSS)

A serious complication following stimulation of the ovaries with gonadotrophin drugs.

Ovary

One of a pair of female reproductive organs which produce eggs and hormones.

Partial Zona Dissection (PZD)

A variation of IVF treatment in which a small hole is made in the outer membrane of the egg using a small glass needle, thereby easing the passage of sperm into the egg under their own motion.

Percutaneous Epididymal Sperm Aspiration (PESA)

Retrieving sperm directly from the coiled tubing outside the testicles that store sperm (epididymis) using a needle.

Preimplantation Genetic Diagnosis (PGD)

Techniques by which embryos fertilised *in vitro* are tested for specific genetic disorders (e.g. cystic fibrosis) or other characteristics such as sex before transfer to the uterus.

Pregnancy rate

The number of pregnancies achieved from every 100 treatment cycles commenced.

Spermatid

An immature sperm cell.

Stillbirth

The birth of a dead infant.

Stimulation drugs

Drugs used to stimulate a woman's ovaries to produce more eggs than usual in a monthly cycle; also known as superovulatory drugs.

Stimulated cycle

A treatment cycle in which stimulation drugs are used to produce more eggs than usual in the woman's monthly cycle.

Superovulation/stimulation

The stimulation of a woman's ovaries with drugs to produce more eggs than usual in a monthly cycle.

Testicular Sperm Extraction (TESE)

Retrieving sperm directly from the testis.

Testis

Testicle or male gonad.

Treatment cycle

- a) IVF with fresh embryos: a cycle begins with the administration of drugs for the purpose of superovulation or, if no drugs are used, with the attempt to collect eggs;
- b) IVF with frozen-thawed embryos: a cycle begins with the removal of the stored embryo in order to be thawed and then transferred;
- c) DI: a cycle begins when the first insemination with donor sperm takes place.

Unknown outcome

The outcome of a clinical pregnancy is unknown due to incomplete information being returned by a clinic to the HFEA.

Zona drilling (ZD)

Acid released to dissolve the gelatinous coating of the egg leaving a hole through which the sperm can enter.
